Three mountain ranges define Jefferson County

By Bret Lian

What separates one mountain range from another is a fuzzy thing, and revolves around attributes like geology, separative water bodies, and basin and range relief. Here in Jefferson County, there are three different mountain ranges, and perhaps more if one decides to delineate those larger chunks of earth thrust to the sky into subranges, themselves even harder to define.

In our country, the U.S. Board of Geographic Names is the keeper of the toponyms you see on the map. For many of those features, boundaries are documented and defined. In a past column, we learned that the Boulder Mountains, which fill in the western half of the county, were not named until 1986 by Edward Ruppel, and when he did so, he submitted a distinct boundary for that place-name.

Topographically, Jefferson County is largely mountain ranges, their gulches, and the valleys between. Three mountain ranges occupy Jefferson County. They are all distinct. The Elkhorns, with their volcanic skyline and gradual ascending gulches, contain both the lowest and highest points in Jefferson County. The former being where Prickly Pear Creek leaves the county on its way to Lake Helena, and the latter being the summit of Crow Peak. The Bull Mountains are another range here, surging off the valley floors that bound them with no warning, forming a great ridge more than 20 miles long. Lastly there are the Boulder Mountains, like a pile of rusty anvils strewn on bedrock, where 70 million years ago they melted onto the earth, their summits now covered in lodgepole. All of them are beautiful.

One could say that Doherty Mountain and the relief around it in the southeastern corner of the county is its own subrange, or maybe a part of the Elkhorns. Unlike other mountain ranges in the county, no exact definition or attribution exists for those hills, and all we are left knowing is that while certain mountains are most definitely in the Elkhorns, others, like a "Man Without A Country," are Mountains Without A Mountain Range.

July 2020

The difference between the highest elevation in Jefferson County (Crow Peak) and the lowest, where Prickly Pear Creek leaves the county is a difference of 5,465 feet. Boulder sits at 4,991 feet — 4,424 feet lower than Jefferson County's high point. The lowest point is at 3,950 feet. (Map created by Bret Lian)

Jefferson County has "something for everyone". This column will appear the first issue of each month with a schedule of What's Happening in Jefferson County. Countywide events can also be found on the Jefferson County tourism/recreation website discoverjeffersonmt.org. Send your request to post event information on the website or in this column to Bruce Binkowski, Events Coordinator at bbinkowski@jeffersoncounty-mt.gov.
